Для этой картинки использовался модуль продакши для мастерской. The mainstay of spaceflight and exploration has long been the International Space Station (ISS). The very first space station, the United States' Salyut 1, was based on the design of the space station that would fly seven years later, which in turn became known as the "big station." The first module that flew to the station was Unity, a box measuring 3.8 meters (12 feet) long by 1.9 meters (6 feet) wide by 2.1 meters (6.5 feet) tall. The box carried enough food, fuel, water and other supplies to keep one astronaut alive for about two weeks. After the U.S.S.R. launched Sputnik in 1957, both the United States and the Soviet Union began building space stations to explore space and to promote their own space programs. By 1968, two space stations, America's Skylab and the U.S.S.R.'s Salyut 3, were operational, and the "small station" era was born. Small space stations were used to study the effects of weightlessness on astronauts and to carry out various experiments. By the early 1970s, the Soviet Union was working on a new type of space station. After the Soviets launched the first long-duration space station, Salyut 6, in 1971, they began working on what would eventually become known as the "new station" (also known as the "Mir"). The new station, which was the first to use thermal
