Category:Commercial video games with freely available source code Category:Formerly freely available software Learning effects of postnatal CORT infusion and ascorbate on adult male Wistar rats. To test the concept of the programming of brain development by an early manipulation of the developing brain, on postnatal day (PD) 10.5 male rats were infused through a guide cannula with a physiological concentration of cortisol (10 mg/kg/day for 2 days), ascorbate (250 mg/kg/day for 3 days), or both. Four months later, brain-derived neurotrophic factor (BDNF) levels, histological changes in the dentate gyrus, and learning and memory abilities were evaluated. Both corticosteroid and ascorbate infusion increased BDNF mRNA levels in the hippocampus. Although they also increased cell density in the dentate gyrus, only ascorbate infusion significantly increased the density of large neurons in the subgranular zone. In the Morris water maze, rats that had been infused with ascorbate showed a reduction of the latency to find the platform and a greater number of crossing errors. In the Y-maze, rats that had been infused with ascorbate showed a greater number of spontaneous alternations. This effect was abolished by the administration of RU-38486, a glucocorticoid receptor antagonist. Corticosteroid and ascorbate infusion did not significantly alter the learning and memory capacities of adult rats. This study reveals that postnatal ascorbate administration affects cell density and the performance of the Morris water maze in rats. Reinnervation of the rat penis with a new microvascular free flap. We have devised a new microvascular free flap for penis reconstruction, using vessels of the internal pudendal artery, a major component of the deep circumflex iliac system. This microvascular free flap was used to examine the histomorphologic aspects of reinnervation of the 2d92ce491b
