Although our present data cannot rule out contribution of extrapair parental care to anxiety-like behaviors in female offspring, the present data suggest that the influence of the paternal side of care on anxiety-like behaviors emerges in adulthood. There are several methodological issues for these studies. First, the current study used a cross-fostering design with a mouse donor mother. This design does not completely rule out the possibility that an enriched environment experienced by the donor mother might influence the anxiety-like behavior of the mouse donor. Indeed, the enriched environment for the mother was in part based on what was observed in the donor mouse during the present study. However, two lines of evidence suggest that the impact of the enriched environment is negligible. First, in a study using the same test method, the novel environment was taken as a contextual control. If the cross-f [f30f4ceada](#)
