Baby ; Download Co(2015).Q: How to tell the base class to initialize one member with a value I have a DataPacket class, and a DataPacketParser class. The Parser generates a DataPacket object from a serialized DAT file. It defines a member of type TTransformer. The T is the same type as the DataPacket object. How can I tell the DataPacket constructor to initialize the T member with the contents of the DAT file? I don't think it should matter, but it is a.NET 4.0.NET Framework class library project. EDIT: I am looking for the equivalent of: public sealed class DataPacket { public DataPacket(string file) { // Ignore parsing the file } public string Data { get; set; } } and public class DataPacketParser { public static T Transform(DAT serialization) { // Parse the data to get the T } } A: Here is an example from wikipedia. public interface IParameter { object Value { get; set; } } public class ParameterValue : IParameter { private ParameterValue() { // This will be
